

Case studies
SLIMPA

The **Slimpa** company represents the productive pole of the "electrical control package" for elevators, distributed by **Kone** all over the world. CASSIOLI has designed and deployed the new **assembly, testing and shipment line**. The whole system also includes an **automated warehouse**. The plant has a storing capacity of 118 bays. The purpose of this warehouse is to separate assembly and testing activities of electrical panels from integration activities. In fact, due to different work contents and different cycle times, integration was the bottleneck of the old, unoptimized manufacturing process.
